

Project Specifications: Customizing eClassify Script for OLX-Style Marketplace with Escrow and Wallet Features Pakistan-Based

Classified Marketplace Date: October 18, 2025

1 Project Overview

This document outlines the customization requirements for the eClassify script (Flutter mobile app for Android/iOS, Next.js frontend website, and Laravel admin panel) to create a Pakistan-based classified marketplace similar to OLX. The focus is on implementing an internal wallet system, escrow/milestone payments (without third-party dependencies for holding funds), order management, local payment integrations, badges, commissions, and admin controls. All features must be secure, user-friendly, and integrated across mobile, web, and admin interfaces. Funds for escrow must be managed internally via the platform's database and logic.

2 High-Level Goals

1. Implement a user wallet system with deposit, withdrawal, transaction history, and admin controls, including per-transaction fees for deposits and withdrawals.
2. Add a full escrow/milestone payment system for secure buyer-seller transactions.
3. Introduce an order system with "Buy Now" flow supporting Escrow or Cash-on-Delivery (COD), including shipping/tracking fields and order statuses.
4. Integrate local Pakistani payment methods (automatic and manual options).
5. Add seller/buyer activity counters and a badges system with paid applications.
6. Ensure all settings (fees, commission tiers, badge fees, gateway toggles, per-transaction deposit/withdrawal fees) are configurable via the Laravel admin panel without code changes.
7. Display wallet and orders in the user profile via dropdowns or tabs for easy access.

3 Feature Details and Expected Flows

3.1 Wallet System

Add a per-user wallet balance and transaction records (deposits, withdrawals, refunds, admin adjustments). The wallet will handle internal fund reservations for escrow/milestones without third-party services. Each deposit and withdrawal must incur a configurable fee, set via the admin panel.

3.1.1 Wallet Actions

- **Deposit:** Users can deposit via integrated payment gateways or manual upload (e.g., screenshot/transaction ID). Apply a per-transaction fee (percentage or flat, configurable in admin panel).
- **Withdrawal:** Users request payouts; admin approves/rejects with reasons. Apply a per-transaction fee (percentage or flat, configurable in admin panel).
- **Create Milestone:** Triggered from Buy Now/Order flow; reserves funds in wallet/escrow.
- **Completed Payments:** Release funds to seller upon milestone completion.
- **Pending Payments:** Hold funds in escrow/milestones until release or resolution.

3.1.2 UI/UX

- In the user profile menu (top-right or sidebar), add a "Wallet" link. On click, show a dropdown or page with: Current Balance, Deposit button/form (display applicable fee), Withdraw button/form (display applicable fee), Transaction History table (date, type, amount, fee, status), and Pending Milestones list.
- Support for both web (Next.js) and mobile (Flutter) views.

3.1.3 Notifications

- Send email and in-app push notifications (via Firebase) for deposit success (including fee charged), withdrawal approval/rejection (including fee charged), milestone funding/release.

3.2 Escrow & Milestone System (Buyer-Seller Flow)

Implement an internal escrow system where the platform holds funds in the user's wallet/database until conditions are met. Support single payments or multiple milestones.

3.2.1 Flow

- Buyer clicks "Buy Now" → Select payment method: Escrow or COD.
- **If Escrow:** Display modal to create milestone(s) or single payment (allow specifying advance amount if needed). Buyer funds via wallet balance or direct gateway. Milestone statuses: Created → Funded → In Progress → Released / Disputed / Refunded.
- **If COD:** Show shipping address form; create order with COD payment (no upfront payment).

3.2.2 Additional Features

- Seller can mark order as shipped, adding tracking number and courier name.
- Admin intervention: View disputes, issue refunds, force releases, or resolve manually.
- Integrate with notifications for status changes.

3.3 Order System & UI

Add a dedicated orders module to track purchases beyond simple listings.

3.3.1 Flow & UI

- Add "Buy Now" button on every item/product page (next to existing "Contact Seller" or "Chat" buttons).
- Also display "Buy Now" inside chat UI (e.g., small button under item preview or in chat header when discussing a specific item).
- On purchase: Create an order record with statuses: New → Processing → Shipped → Delivered → Completed, or Cancelled/Refunded.
- Orders dashboard (user and admin views): Tables with filters for Completed, Pending, New, Cancelled, Disputed. Include columns for order ID, item, buyer/seller, status, date, amount.

3.3.2 Integration

- After order completion, prompt both buyer and seller to leave reviews/ratings (integrate with existing review system).

3.4 Commission System & Fees

Implement tiered commissions and per-transaction fees configurable by admin.

3.4.1 Commission Tiers (Admin-Configurable)

- 100 to 5,000 PKR
- 5,001 to 10,000 PKR
- 10,001 to 20,000 PKR
- 20,001 to 50,000 PKR
- 50,001 to 100,000 PKR

3.4.2 Details

- Admin defines % commission or fixed fee per tier.
- Per-transaction fees for deposits and withdrawals (% or flat amount), configurable per gateway or globally in admin panel.
- Logic: When buyer funds a milestone, calculate and store platform fee. On release, seller receives (total amount - platform fee). Deduct deposit/withdrawal fees automatically during transactions and display in transaction history.

3.5 Badges System (Apply + Paid)

Add badges to recognize sellers based on activity.

3.5.1 Badges and Eligibility

- Trusted Seller: Eligible after 50 completed orders.
- Premium Seller: Eligible after 100 completed orders.

3.5.2 Flow

- Users apply for badges from their profile page (pay a configurable fee per badge via wallet or gateway).
- After payment, application goes to admin for manual approval/rejection.
- Admin panel: List badges, set fees, define eligibility criteria, view/approve/reject applications.
- Display approved badges on user profiles and listings.

3.6 Payment Methods (Pakistan-Specific)

Integrate gateways for deposits, withdrawals, and escrow funding. All must be configurable in admin panel with per-transaction fees.

3.6.1 Automatic Gateways (API/Web Checkout for Checkout & Wallet Deposits)

- EasyPaisa
- JazzCash
- PayFast (if available in region)
- PayMob (for cards)

3.6.2 Manual Payment Options (for Deposits)

- EasyPaisa (manual: user uploads screenshot/transaction ID)
- JazzCash (manual: same as above)
- Bank Transfer (manual: same)

3.6.3 Admin Controls

- Enable/disable each gateway.
- Configure API credentials and test mode.
- Set per-gateway or global fees (% or flat) for deposits and withdrawals.

3.7 Profile / UI Placements

Ensure features are intuitive and visible.

- **Profile Top-Right Menu:** Add links for "Wallet" and "Orders".

- **Profile Page:** Add tiles/cards showing Sales Count (for sellers) and Buy Count (for buyers).
- **Item Page:** Place "Buy Now" button next to "Contact Seller" / "Chat".
- **Chat Screen:** Add "Buy Now" CTA (small button) under item preview or in chat header.

4 Admin Panel: Required Sections & Settings

Extend the Laravel admin panel with new sections for full control. Use Voyager or similar for CRUD interfaces where possible.

- **Payments → Payment Gateways:** Configure credentials, enable/disable, test mode; set default deposit/withdrawal fees (per-transaction, % or flat, per gateway or global).
- **Escrow → Settings:** Auto-release delay (e.g., days after delivery), dispute time limits (e.g., days to file).
- **Fees & Commissions → Manage:** Edit commission tiers, platform fee %, badge fees, deposit/withdrawal fees.
- **Orders → Manage:** View/edit order statuses, shipment updates, manual refunds/dispute resolution.
- **Badges → Configure:** List badges, set eligibility/fee, approve/reject applications.
- **Wallets → Manage:** View user balances, force adjustments (add/subtract with reason), approve/reject withdrawals.

5 Deliverables & Acceptance Criteria

1. All flows must function seamlessly on website (Next.js), mobile app (Flutter), and admin panel (Laravel). Test mobile-specific screens (e.g., wallet, buy flow).
2. Admin controls in Laravel must allow dynamic changes to fees/tiers (including per-transaction deposit/withdrawal fees) without requiring code modifications (use database-driven configs).
3. Provide database migrations and seeders for new tables (e.g., wallets, orders, milestones, badges). Include short API documentation for new endpoints (e.g., Swagger or simple Markdown).
4. Include unit/integration tests for critical flows: Funding a milestone, releasing funds, processing withdrawals (including fee calculations).
5. Deliver a deployment checklist (e.g., server requirements, env variables) and conduct a one-hour handover/demo session to explain setup and features.
